

7000 Series Coil Packers

A PROVEN INVESTMENT FOR CONSERVATION FARMING

The K-Line 7000 Series Modular Coil Packer has proven to be one of the most effective means of packing a seed bed to improve germination. Moisture is retained through the firming and sealing of the seed bed and the pressing gives optimum seed to soil contact even in the presence of trash and stubble.

7000 Series Coil Packers condition the soil so it is friable and receptive to additional rainfall. They also leave a herringbone pattern to control wind and water erosion. These two features help to prevent the 'crusting' and 'washing' or 'scaring' commonly associated with the soild drum and tyre roller.

**45mm SQUARE - cold rolled • HEAVY DUTY COILS - 197kg/metre approx
LARGE DIAMETER - 530mm • HEAVY DUTY CONSTRUCTION**

Used in conservation and conventional tillage systems, the Coil Packers are a great advantage when used for seed bed preparation, seed establishment and stubble management. They can be supplied in various configurations from 4' - 80' as shown opposite.

- Soil conditioning - soil levelled and firmed for good seed to soil contact - improved germination
- Moisture retention - firming and sealing of seed bed conserves valuable moisture
- Stubble management - residue knockdown for faster breakdown of stubble
- Establishment of small seed crops
- Herringbone pattern left by packers to reduce wind and water erosion
